Representing Stimulus Histories

Representing Functions: Sampling

Nyquist Sampling

The Nyquist-Shannon Sampling Theorem

If $f(t)$ contains no frequencies greater than B then it is *completely* determined by samples spaced $\Delta t = \frac{1}{2B}$ apart ($N = 2BT$ equally spaced samples for a time-slice $[0, T)$). There is a *one-to-one mapping* between the samples x and the function $f(t)$.

Representing Functions: Sampling $< 3\text{Hz}$

Continuous function

Linear interpolation ($N = 6$; RMSE=0.2)

Cubic interpolation ($N = 6$; RMSE=0.1)

Sampled function ($N = 6$)

Quadratic interpolation ($N = 6$; RMSE=0.09)

Nyquist reconstruction ($N = 6$; RMSE= $3e-05$)

Representing Functions: Fourier Basis

Representing Functions: Cosine Basis

Representing Functions: ReLU Basis

Representing Functions: Legendre Basis

Legendre Polynomials ($q = 6$)

Implementing the Delay Network

$$\theta \mathbf{A} = a_{ij} \in \mathbb{R}^{q \times q},$$

$$\theta \mathbf{B} = b_i \in \mathbb{R}^q,$$

$$\mathbf{A}' = \tau \mathbf{A} + \mathbf{I}$$

$$a_{ij} = \begin{cases} (2i+1)(-1) & i < j, \\ (2i+1)(-1)^{i-j+1} & i \geq j \end{cases}$$

$$b_i = (2i+1)(-1)^i$$

$$\mathbf{B}' = \tau \mathbf{B}$$

Delay Network: Step Function

Delay Network: Windowed Sine Function
