SYDE 556/750

Simulating Neurobiological Systems Lecture 4: Temporal Representations

Chris Eliasmith

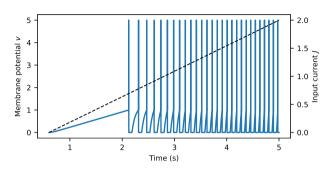

Sept 18 & 23, 2024

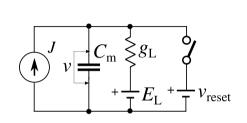

- ► Slide design: Andreas Stöckel
- ► Content: Terry Stewart, Andreas Stöckel, Chris Eliasmith

Reminder: The LIF Neuron

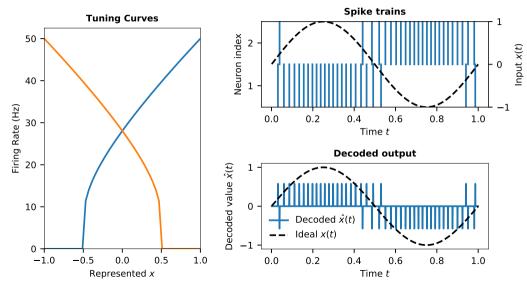

$$egin{aligned} rac{\mathrm{d}}{\mathrm{d}t} v(t) &= -rac{1}{ au_{\mathrm{RC}}} ig(v(t) - J ig) \,, \\ v(t) &\leftarrow \delta(t-t_{\mathrm{th}}) \,, \\ v(t) &\leftarrow 0 \,, \end{aligned}$$

if
$$v(t) < 1 \, ,$$
 if $t = t_{
m th} \, ,$ if $t > t_{
m th}$ and $t \geq t_{
m th} + au_{
m ref} \, ,$

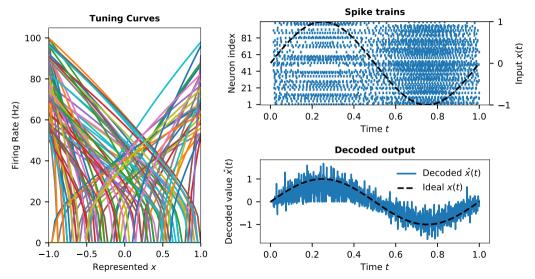

Temporal Decoding

- ▶ Our decoders to this point have ignored time, as we used a rate response function to calculate them.
- ► What happens if we use those decoders with the spike trains generated by spiking LIF neurons?

Temporal Decoding of Two Neurons - Weighted Spikes

Temporal Decoding of One Hundred Neurons - Weighted Spikes

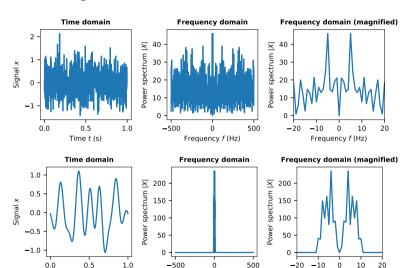

Temporal Decoding

- ightharpoonup For population decoders, we needed to integrate their responses, $\mathbf{a}(\mathbf{x})$, over the represented variable, \mathbf{x} .
- For temporal decoders, we will likely want to integrate their responses, $\mathbf{a}(t)$, over the represented variable, $\mathbf{x}(t)$.
- What space do we want to sample to estimate the integrals?

Random Signals

Time t (s)

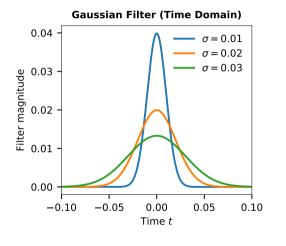

Frequency f (Hz)

Frequency f (Hz)

White Noise (zero mean)

Bandlimited
White Noise
(zero mean,
10 Hz bandwidth)

Filtering by Convolution

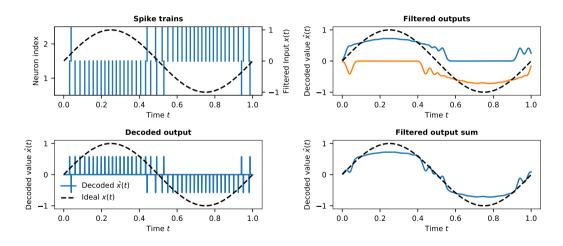

Gaussian Filter

$$h(t)=c\exp\left(rac{-t^2}{\sigma^2}
ight)$$
 where c chosen s.t. $\int_{-\infty}^{\infty}h(t)\,\mathrm{d}t=1$

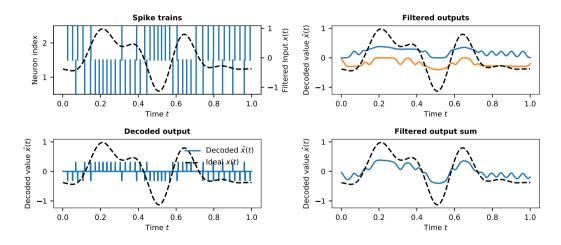

Convolution

$$(f*h)(t) = \int_{-\infty}^{\infty} f(t-t')h(t') dt'$$

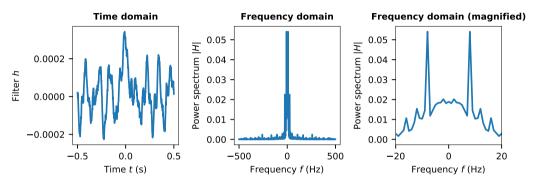

Filtering a Spike Train

Filtering a Spike Train for a Random Signal

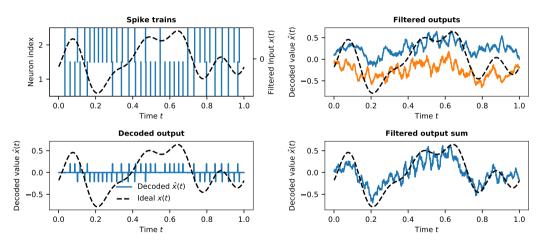

Optimal Filter

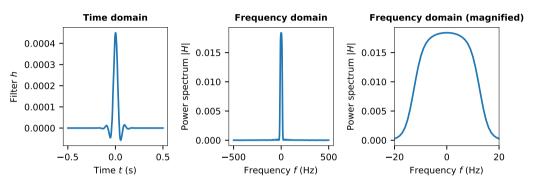

$$H(\omega) = \frac{X(\omega)\overline{R}(\omega)}{|R(\omega)|^2}$$

Filtering a Spike Train for a Random Signal (Optimal Filter)

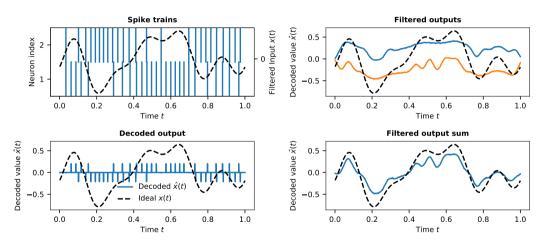

Optimal Filter (Improved)

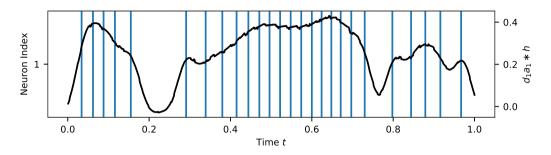

$$H(\omega) = \frac{X(\omega)\overline{R}(\omega) * W(\omega)}{|R(\omega)|^2 * W(\omega)}$$

Filtering a Spike Train for a Random Signal (Improved Optimal Filter)

Pros and Cons of the Optimal Filter

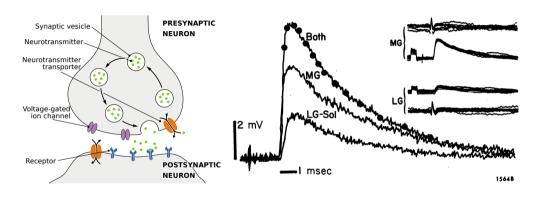

Precise
Good for analysing data after the fact

Non-causal

Does not describe a biological process

We need to find a mechanism that low-pass filters spikes over time!

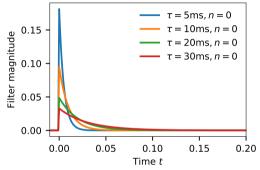

Synapses as Filters

Post-synaptic currents (EPSCs, IPSCs) are low-pass filtered spike trains!

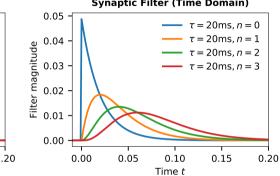

Exponential Low-Pass Filter (I)

$$h(t) = egin{cases} c^{-1}t^n \exp^{-t/ au} & ext{if } t \geq 0\,, \ 0 & ext{otherwise}\,, \end{cases}$$

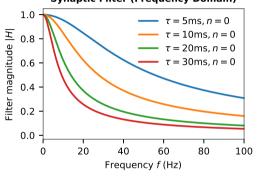

Synaptic Filter (Time Domain)

where
$$c=\int_0^\infty t^n \exp^{-t/ au}\,\mathrm{d}t$$
 .

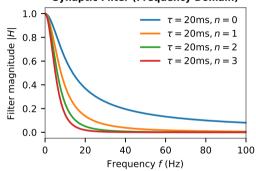

Exponential Low-Pass Filter (II)

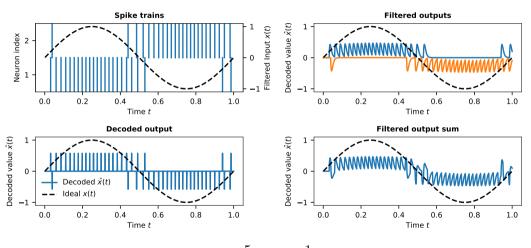

$$h(t) = egin{cases} c^{-1}t^n \exp^{-t/ au} & ext{if } t \geq 0\,, \ 0 & ext{otherwise}\,, \end{cases}$$

Synaptic Filter (Frequency Domain)

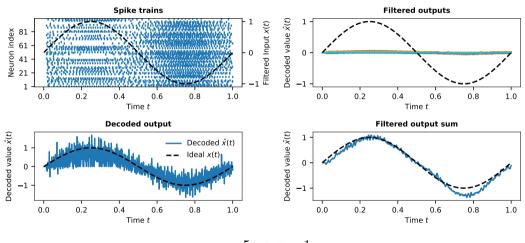

where
$$c=\int_0^\infty t^n \exp^{-t/\tau} \,\mathrm{d}t$$
 .

Example: Synaptic Filter for Two Neurons

Example: Synaptic Filter for One Hundred Neurons

$$\tau=5\,\mathrm{ms}, \textit{n}=1$$
